

TEST SUMMARY REPORT

Flame & Crust — Web Ordering Platform

QA Testing Cycle Summary

Report Field	Detail
Application	Flame & Crust web ordering platform (webshop)
Report date	19 July 2026
Prepared by	Kavin Jayawardena
Source records	Functional Test Cases, API Test Cases, Exploratory/Bug Log, Risk-Based Test Prioritisation

1. Scope and Test Environment

This report summarises the testing carried out on the Flame & Crust web ordering platform, covering functional (UI) testing, API/technical testing, exploratory testing, and cross-browser/responsive testing across the customer-facing ordering journey.

1.1 Features in scope

- Sign up, login, and logout
- Outlet selection and outlet search
- Food item search in the Order Now section
- Cart management — adding, removing, and updating item quantities
- Core API endpoints — login, add-to-cart, and outlet/menu fetch
- Table reservation flow (covered under exploratory testing)
- Cross-browser (Chrome vs. Edge) and responsive checks on tablet and mobile viewports

1.2 Test environment

The test records do not include a dedicated environment log (browser versions, OS builds, or test dates). Based on evidence referenced in the bug log and API testing notes, the following environment coverage can be confirmed:

- Browsers: Google Chrome (primary, verified via Chrome DevTools Network tab) and Microsoft Edge (cross-browser check — see Section 3.3)
- Devices: Desktop/web, Tablet (portrait and landscape orientation), and Mobile (portrait and landscape orientation)
- Execution dates: not recorded against individual test cases

2. Test Execution Summary

A total of 62 test cases were logged across functional and API testing, and all cases now have a recorded execution outcome. The table below summarises execution outcomes by test category.

Test Category	Total Cases	Pass	Fail	Not Executed / Blocked
Functional Testing (UI)	58	51	7	0
API / Technical Testing	4	3	1	0
Total	62	54	8	0

3. Defect Summary

Twenty-one defects/issues were identified in total: 13 from dedicated exploratory/UI testing — including cross-browser and responsive findings — and 8 additional failures observed during functional and API test execution.

3.1 Defects by severity

Severity	Count	Source
High	6	4 from exploratory bug log; 2 from functional/API failures
Medium	3	1 from exploratory bug log; 2 from functional failures
Low	12	8 from exploratory bug log; 4 from functional failures
Total	21	

3.2 Top 3 most impactful issues

#	Issue	Severity	Impact
1	Login API returns 500 Internal Server Error for invalid credentials (API-002), instead of a handled 401/validation response	High	Core authentication flow fails ungracefully; indicates unhandled server-side exceptions rather than input validation
2	"Continue Shopping" button missing on the outlet selection page (Bug_ID_009, tablet)	High	Blocks users from progressing past outlet selection — a hard stop in the ordering journey on tablet devices
3	Login form not displayed properly during the table reservation flow (Bug_ID_010, tablet)	High	Blocks users from completing login mid-reservation, directly affecting a revenue-generating flow

Other notable High-severity issues: the outlet list is not scrollable in landscape mode on mobile (Bug_ID_012), the quantity "+" button is not visible in portrait mode on tablet (Bug_ID_008), and the application allows navigation to continue when the outlet-selection page is offline (TC-038), rather than blocking or warning the user.

3.3 Cross-browser and responsive findings

Per the assignment's Task 4, a subset of functional test cases was repeated on a second browser (Microsoft Edge) and on tablet/mobile viewports, with differences logged as additional bug entries rather than a separate report:

- Microsoft Edge: noticeably faster navigation and scrolling compared to Chrome on the same flows (Bug_ID_013) — a performance regression specific to Edge.
- Tablet (portrait): quantity "+" button not visible on the cart (Bug_ID_008); outlet logos misaligned (Bug_ID_006); "Continue Shopping" button missing on outlet selection (Bug_ID_009); login form not displayed properly during table reservation (Bug_ID_010).
- Mobile (landscape): outlet list not visible or scrollable (Bug_ID_012).
- Tablet: refreshing the page after selecting an outlet redirects to the shop homepage instead of simply clearing the selection (Bug_ID_011).

All of the device-specific defects above are High or Medium severity, and three of the top-impact issues in Section 3.2 are tablet-specific — cross-browser/responsive coverage surfaced a disproportionate share of the release's most serious defects relative to the number of test cases repeated.

4. Overall Risk Assessment and Recommendation

4.1 Risk-based coverage check

Cross-referencing execution results against the project's own risk-based prioritisation shows a mismatch between risk and test coverage:

Module	Risk Score	Risk Level	Coverage Status
Checkout / Payment	25	Critical	No test cases recorded — untested
Cart (add / remove)	20	Critical	10/10 cases executed — all passing
Outlet Selection	16	High	Executed; High-severity UI defects found (missing Continue button, unscrollable list)
Order Now / Search	16	High	Executed; mostly passing, minor input-handling gaps
Sign Up / Login	12	High	Executed; API-level failure on invalid login (500 error)
Order History	6	Medium	Not covered in the reviewed test set

4.2 Recommendation: Ship with Caveats

Based on the evidence reviewed, the release can move forward only WITH CAVEATS — it is not yet a clean, unconditional sign-off. This is driven by:

- Cart, the largest previously-untested Critical-risk module, is now fully executed with all 10 cases passing — a meaningful improvement in coverage and confidence.
- Checkout/Payment, the single highest-risk module on the project's own risk matrix (score 25), still has no recorded test cases at all. This remains the biggest open gap.
- A High-severity defect persists in the login API (500 error on invalid credentials), which sits in a High-risk module and points to unhandled backend exceptions.
- Multiple High-severity UI defects still block core navigation (missing Continue Shopping button, unscrollable outlet list, hidden login form) on tablet and mobile devices.

Caveats for shipping: (1) Checkout/Payment must be tested — at minimum a basic pass/fail pass — before this release is exposed to real transactions, or that flow must be explicitly excluded/feature-flagged from the release scope; (2) the three top-impact defects in Section 3.2 must be fixed or formally risk-accepted by the business with a documented mitigation (e.g., temporarily restricting tablet/mobile checkout); (3) the duplicate Test Case ID issue should be resolved so future defect-to-test traceability is reliable. If Checkout/Payment cannot be tested before release, the recommendation reverts to Not Ready to Ship.

5. Suggestions for Improvement

5.1 Product

- Fix the login API's handling of invalid credentials so it returns a proper 401/validation response instead of a 500 error.
- Restore/fix the "Continue Shopping" button on the tablet outlet-selection page and the unscrollable outlet list in mobile landscape mode.
- Fix login form visibility in the table reservation flow on tablet.
- Add graceful offline/network-interruption handling across sign-up, outlet search, and outlet selection (currently several flows show no error message, or allow the user to proceed despite no connection).
- Trim leading/trailing whitespace consistently in the Email Address and food-item search fields.
- Constrain or wrap long search input text so it cannot overflow the outlet-selection panel.
- Investigate the navigation/scrolling performance gap on Microsoft Edge relative to Chrome (Bug_ID_013) and bring it in line.

5.2 Process

- Create and execute dedicated Checkout/Payment test cases before the next sign-off — it is the project's own highest-risk module and currently has zero coverage.
- Resolve duplicate Test Case IDs (TC-038 used twice; TC-001–TC-010 reused across three feature groups) to keep defects and results traceable to a unique case.
- Expand cross-browser/responsive coverage beyond the current spot-check (one extra browser, a handful of repeated cases) — a disproportionate share of top-impact defects came from tablet/mobile, suggesting more of the suite should be run there routinely.
- Add a severity/priority rating and a suggested fix for Bug_ID_013 (currently missing both) so it can be triaged alongside the rest of the log.
- Capture test environment details (browser + version, device, OS, orientation) and execution date per test case, not only in ad-hoc bug notes.
- Assign severity and priority consistently to functional/API test failures, the way the exploratory bug log already does, so all defects can be triaged from one view.
- Add a regression pass after defect fixes for the three top-impact issues, and re-run the risk-based prioritisation check before the next release decision.
